There is a planned launch (no earlier than December) of SpaceX CRS-21 Cargo mission to the International Space Station (ISS). It will launch on a Falcon 9 rocket from Kennedy Space Centre, Florida.

There is a planned launch (no earlier than December) of a Boeing Orbital Test Flight 2. For this second uncrewed flight test, Boeing's CST-100 Starliner will launch atop a United Launch Alliance Atlas V rocket. OFT-2 will fly a new, reusable Starliner crew module providing additional on-orbit experience for the operational teams prior to flying missions with astronauts.

On the 1" at 6:00pm the star Zeta Tauri ( 2.9 mag ) in Taurus is just 2 degrees to the lower right of the Moon.
From the $1^{\text {st }}-4^{\text {th }}$ Mars passes within $1 \frac{1}{4}$ degrees of the star Epsilon Piscium ( 4.2 mag ) in Pisces. On the $1^{\text {st }}$ at $8: 30 \mathrm{pm}$ Mars is due south.

At 10:00pm on the 2 the star Mebsuta ( 3 rd mag) in Gemini is less than a degree upper left of the Moon. An occultation of Mebsuta by the Moon also occurs though this will only be seen from central Africa and the south Middle East.

From the $2^{\text {nd }}-4^{\text {th }}$ Comet C/2020 M3 Atlas ( $9.5 \mathrm{mag}-$ Nov $17^{\text {th }}$ ) is passing close to Elnath ( 1.6 mag ) in Taurus. On the $3{ }^{\text {rd }}$ its less than a degree from the star Elnath. (For details on this comet or others listed please see the "Comet" section in the website above).

From the $2^{\text {nd }}-5^{\text {th }}$ Venus passes close to the star Zubenelgenubi ( 2.7 mag ) in Libra. On the $4^{\text {th }}$ at 6:30am its just $11 / 2$ degrees to the right of Venus low in the south east.

On the $3^{\text {rid }}$ at midnight the star Kappa Geminorum ( 3.5 mag ) in Gemini is $1 / 2$ a degree above left of the Moon. An occultation of Kappa Geminorum by the Moon also occurs though this will only be seen from central Africa and the south Middle East.

At midnight on the $4^{\text {tr }}$ the Beehive star cluster in Cancer is $21 / 4$ degrees below right of the Moon.
On the $5^{\text {m }}$ at $10: 30 \mathrm{pm}$ the stars Rasalas ( 3.8 mag ) and Epsilon Leonis ( 2.9 mag ) in Leo point the way to the Moon. Six degrees separates Epsilon Leonis from the Moon.

At 10:45pm on the $6^{\text {n }}$ the stars Adhafera ( 3.4 mag ) and Algieba ( 2 nd mag ) in Leo point the way to the Moon. The star Regulus ( 1.3 mag ) is 5 degrees to the right of the Moon low in the east. There is an occultation of star Eta Leonis by the Moon which will be seen from east Asia and Hawaii.

On the $7^{\text {tr }}$ at midnight the star Chertan ( 3.3 mag ) in Leo is 6 degrees upper left of the Moon. The star Denebola ( 2.1 mag ) is $81 / 2$ degrees left of the Moon... ...Then at 6:00am on the $8^{\text {tr }}$ all three celestial objects form a near perfect equilateral triangle in the south.

From the $7^{\text {th }}-11^{\text {th }}$ Comet 156P Russell-Linear ( 10.5 mag - Nov $17^{\text {th }}$ ) passes close to the star Algenib ( 2.8 mag ) in Pegasus. On the $8^{\text {th }}$ at $8: 00 \mathrm{pm}$ Russell-Linear is approximately $11 / 4$ degrees below left of Algenib.

At 6:30am on the $9^{\text {th }}$ the star Zaniah ( 3.8 mag ) in Virgo is 3 degrees below the crescent Moon and $11 / 4$ degrees to the right.

On the $10^{\text {m }}$ at 6:00am the star Spica ( 0.9 mag ) in Virgo is 8 degrees below the crescent Moon.
The Taurids meteor shower reached their peak on the $10^{\text {th }} / 11^{\text {th }}$ November, though they can be seen till $9^{\text {th }}$ December.

At 6:00am on the $11^{\text {m }}$ the star Kappa Virginis ( 4.1 mag ) in Virgo is $11 / 2$ degrees below left of the crescent Moon.

From the $11^{*}-30^{n}$ Jupiter and Saturn pass within 1 degree of each other. On the $21^{*}$ Jupiter and Saturn are in close conjunction and less than $1 / 4$ of a degree apart in the south western sky around 5:00pm.

Comet C/2020 S3 Erasmus ( $7.3 \mathrm{mag}-$ Nov $17^{\text {th }}$ ) is at perihelion on the $12^{\text {th }}$ ( 0.399 AU from the Sun). Due to its position its unlikely to be seen this month from the UK.

On the $12^{\text {m }}$ at $6: 30 \mathrm{am}$ Venus is $71 / 2$ degrees below left of the thin crescent Moon. The star Zubenelgenubi (2.7 mag ) in Libra is $31 / 2$ degrees to the right of the Moon and 1 degree above. The moon is at perigee $(361,773 \mathrm{~km}$ ) at $8: 43 \mathrm{pm}$. An occultation of Venus by the Moon occurs this day which will be seen from eastern Russia and the western half of north America.

At 7:00am on the $13^{n}$ Venus is $6^{1 / 2}$ degrees above right of a very thin crescent Moon which is $31 / 4$ degrees above the horizon at 128 degrees azimuth. The star Acrab ( 2.5 mag ) in Scorpius is less than $1 / 2$ a degree above the Moon.

There is a Total Eclipse of the Sun on the $14^{\text {th }}$. This will be visible through the central region of Chile and Argentina. The partial phases will be seen over the lower two thirds of South America and the west side of Southern Africa before the Sun sets. Greatest eclipse occurs at 4:13:22.9pm.

The Geminids meteor shower reach their peak on the $14^{\text {th }} / 15^{\text {th }}$, though they can be seen from the $4^{\text {th }}-$ $17^{\text {th }}$.

On the $15^{\text {m }}$ at $4: 25 \mathrm{pm}$ a very thin crescent Moon may be seen low in the south west. It will be $11 / 2$ degrees above the horizon at 224 degrees azimuth.

At $5: 00 \mathrm{pm}$ on the $16^{\text {n }}$ a thin crescent Moon will be seen in the south west. Its $41 / 2$ degrees above the horizon and at 219 degrees azimuth. Jupiter and Saturn are $81 / 2$ degrees above left of the moon.

On the $17^{\text {th }}$ at $5: 00 \mathrm{pm}$ Jupiter and Saturn ( 1 degree apart) are 7 degrees right of the crescent Moon. The star Psi Capricorni ( 4.1 mag ) in Capricornus is $23 / 4$ degrees to the left of the Moon and 1 degree below.

From the $17^{\prime \prime \prime}-21^{\text {n }}$ the asteroid Vesta passes close to the star Iota Leonis (4" mag) in Leo. On the 19" at 6:00am its $3 / 4$ of a degree below Iota Leonis in the south.

From the $17^{\text {th }}-23^{\text {rd }}$ Comet 88 P Howell ( $9.1 \mathrm{mag}-$ Nov $16^{\text {th }}$ ) passes close to the stars Nashira ( 3.6 mag ) and Delta Capricorni ( 2.8 mag ). On the $18^{\text {th }}$ at $6: 00 \mathrm{pm}$ Howell will be just 1 degree below right of Nashira and $21 / 4$ degrees above the crescent Moon.

At 7:50pm on the 18 " the star Delta Capricorni ( 2.8 mag ) in Capricornus is $41 / 4$ degrees above the crescent Moon.

On the $19{ }^{\text {m }}$ at $9: 00 \mathrm{pm}$ the star Skat ( 3.2 mag ) in Aquarius is 5 degrees to the left of the crescent Moon and 3 degrees above.

Mercury is at superior conjunction on the $20^{\circ}$.
From the $20^{m}-25^{m}$ the asteroid Ceres is passing close to the star Skat ( 3.2 mag ) in Aquarius. On the $22^{\text {mad }}$ / 23 at $7: 00 \mathrm{pm}$ it will be 1 degree to the lower left of Skat.

At 9:00pm on the $20^{\mathrm{m}}$ the star Psi Aquarii ( 4.4 mag ) in Aquarius is $13 / 4$ degrees upper right of the Moon. Its the middle one of the three stars, which is slightly higher than the other two. Neptune is $41 / 2$ degrees above the Moon and $2 \frac{1}{2}$ degrees to the right.

On the 21* at 9:00pm the star Iota Ceti ( 3.5 mag ) in Cetus is 5 degrees to the left of the Moon.
The Ursids meteor shower reach their peak on the $21^{\text {st }} / 22^{\text {nd }}$, though they can be seen from the $16^{\text {th }}-25^{\text {th }}$.
At midnight on the $23^{*}$ Mars is $5^{1 / 2}$ degrees to the upper right of the Moon.
The moon is at apogee ( $405,012 \mathrm{~km}$ ) on the $24^{\text {m }}$ at $4: 32 \mathrm{pm}$. At midnight Uranus is $2 \frac{3}{4}$ degrees to the upper right of the Moon.

On the $26^{\prime \prime}$ at midnight the Pleiades star cluster is 6 degrees above right of the Moon.
Solar Orbiter has a gravity assist manoeuvre with the planet Venus on the 26 " . (See "News: Solar Orbiter" below for further details).

At 7:00pm on the $27^{\text {th }}$ the star Ain ( 3.5 mag ) in Taurus is 2 degrees to the right of the Moon.
On the $28^{\text {th }}$ at midnight the star Zeta Tauri ( 2.9 mag ) in Taurus is $21 / 4$ degrees to the lower left of the Moon.

At 7:00pm on the $29^{\text {th }}$ the star Mu Geminorum ( 2.8 mag ) in Gemini is just $11 / 2$ degrees to the lower right of the Moon.

On the $30^{\text {th }}$ at $8: 00 \mathrm{pm}$ the star Wasat ( 3.5 mag ) in Gemini is 2 degrees to the lower right of the Moon.
At midnight on the $31^{\text {st }}$ the Beehive star cluster in Cancer is 4 degrees below the Moon and 2 degrees to the left. There is an occultation of Kappa Geminorum earlier today which will be seen from Mexico, central America and north west South America.

* = Dates and times are subject to change.

News: It was announced on the $17^{\text {th }}$ November that the world's largest radio telescope is on the brink of collapse. A crucial cable at the Arecibo Observatory in Puerto Rico recently broke-the second such cable to snap in three months

News: Solar Orbiter: The science payload is composed of 10 instruments.
9/10) METIS (Multi Element Telescope for Imaging and Spectroscopy) - Coronagraph (Italy): Simultaneously images the visible, ultraviolet and extreme ultraviolet emissions of the solar and diagnoses, with unprecedented temporal coverage and spatial resolution, the structure and dynamics of the full corona in the range from 1.4 to 3.0 (from 1.7 to 4.1 ) solar radii from Sun centre, at minimum (maximum) perihelion during the nominal mission. This is a region that is crucial in linking the solar atmospheric phenomena to their evolution in the inner heliosphere.

Facts: The last time a conjunction between Jupiter and Saturn, was on the $28^{\text {th }}$ May 2000. On the $17^{\text {th }}$ May in the same year the Sun and the naked eye planets were massed close together - an event that occurs about six times in every 1000 years. This is depicted on the Bude Light 2000 slender cone made in in concrete with colours of sand, sea and sky which is over 9 metres high. As the name suggests it is in Bude, Cornwall.
